

# Welcome to PDF to Audio

This is a small sample document for the PDF to Audio project. The program opens a PDF file, extracts the text from every page, and reads it out loud using a text to speech engine that works completely offline.

## How to use your own file

To listen to your own document, pass its path when you run the script, for example: `python main.py my-notes.pdf`. You can change the reading speed with the `rate` option, choose a different voice, start from any page, or save the audio to a file instead of playing it.
